

The Sheridan River Tributary, AWC# 212-10-10020-2007-3022-4031, flows from a large pond complex upstream and becomes a low gradient moderately contained stream downstream dominated by gravels with fines in depositional zones.

Cordova High School students surveyed the Sheridan River Tributary on 9/26/2014. Ten minnow traps were set along 0.5 km for approximately 20 hours. Traps were set approximately 0.8 km upstream of the upper point listed in the AWC. We caught 147 coho salmon (*Oncorhynchus kisutch*), 98 three spine stickleback (*Gasterosteus aculeatus*), 4 Dolly Varden (*Salvelinus malma*) and 2 coastrange sculpin (*Cottus aleuticus*). Average CPUE for coho salmon was 0.74. We measured 35 coho salmon, 24% of the total catch. Coho salmon fork lengths ranged from 47 - 114 mm (mean 46.4 ± 5.9 mm). We measured 2 Dolly Varden and fork lengths were 130 and 135 mm.
